THE PROBLEM

Water scarcity across South African villages — still happening today

AquaLink

Across South Africa, millions of rural villagers still have no tap at home. Entire villages depend on just 2 or 3 community taps — and when those run dry, there is nothing.

2–3 Taps for an Entire Village

Most rural households have no running water. An entire community shares just a handful of communal taps — often located far from homes.

Taps Run Dry for Days

Even communal taps fail regularly. When pressure drops, villages can go days without any water at all — forcing people to look elsewhere.

Resorting to Rivers

When taps fail, residents — including elderly grandparents — walk to rivers. The water is not always safe for drinking or cooking.

Heavy Physical Burden

Carrying buckets and containers of water long distances is an exhausting daily reality, especially dangerous for the elderly and young children.

THIS IS THE REALITY

Real scenes from villages across South Africa — still happening in 2025

Communities queue at a single tank — Gift of the Givers response, Limpopo 2025

A man transports water by wheelbarrow — the daily commute for millions

An elderly woman collects water alone from a remote borehole

A dry, rusted community tap — water hasn't flowed here in days

WHERE IT ALL STARTED

> *"Two of our team members have grandparents living in rural villages. Growing up, we watched this struggle firsthand."*

In most villages, an entire community's water comes from just 2 or 3 communal taps — not every household has running water.

Some days those taps don't run at all. Residents wake up to no water for cooking, bathing, or drinking — sometimes for multiple days in a row.

When that happens, people resort to fetching water from rivers. That water isn't always safe. And carrying it home — especially for elderly grandparents — is exhausting and dangerous.

AquaLink was born from that reality. We asked: what if we could fix this permanently?

INTRODUCING AQUALINK

A smart, community-driven water access system

AquaLink is a community water supply and management platform that connects borehole owners directly to households — giving every home access to clean, affordable water through a permanent pipe network, subscription plans, and a digital management system.

01

For Households

Subscribers

Clean water delivered via permanent pipe connection to your home tap. Choose a plan that fits your family size and budget. No more queuing, no more rivers.

02

For Borehole Owners

Suppliers

Become a formal AquaLink supplier. Connect your borehole to the network, earn a regular tracked income, and manage your supply from your phone.

03

For Administrators

Management

A full digital dashboard to manage household subscriptions, monitor water usage, receive sensor alerts, and track all payments in one place.

HOW AQUALINK WORKS

From borehole to household tap — a simple, connected system

1

Pipe Infrastructure

20mm HDPE pipes run from a borehole along the street, branching to each registered household — one tap per home.

2

Flow Sensor

A digital flow meter at the borehole records every litre supplied in real time, feeding data to the supplier dashboard.

3

500L Buffer Tank

A gravity-fed buffer tank smooths supply peaks and ensures households receive water even during high-demand hours.

4

Digital Platform

Admins manage household plans and payments. Suppliers monitor tank levels and receive alerts. All accessible via web.

5

Household Tap

The subscriber opens their dedicated tap at home. Clean, traceable water. No queuing. No wheelbarrows.

THE DIGITAL SYSTEM

Two separate platforms — one powerful connected system

ADMIN DASHBOARD

- Real-time overview of all household water purchases and payment status
- Manage all registered households — view plans, usage, and purchase history per home
- 5 subscription plan tiers: Basic 50L, Standard 100L, Premium 150L, Frequent 200L, Family 300L
- Sensor alerts for irregular usage — high, medium, and low priority flagging
- Weekly usage charts and top-household rankings for planning and reporting

SUPPLIER DASHBOARD

- Live tank level readings from IoT flow sensor — see exactly how full each tank is
- Automatic low-level alerts when tank drops below threshold — refill before it runs dry
- Tank level history graphs — day, week, and month views to predict refill needs
- One-tap refill action logs the event and updates the history automatically
- Supplier profile with notification settings and secure login

SUBSCRIPTION PLANS & BUSINESS MODEL

Flexible, affordable plans for every household size

Basic Plan	Standard Plan	Premium Plan	Frequent Plan	Family Plan
6000L	10000L	15000L	20000L	
R150 p/m	R200	R250	R300	
4 households	6 households	8 households	10+ households	

💰 Revenue & Viability

MVP Pilot (10 households)	Supplier paid approx.	Net operating margin	Total infrastructure cost
R 2,500 / month	R 800 / month	≈ R 1,700 / month	R 15,930 (once-off)

MVP — MINIMUM VIABLE PRODUCT

The simplest version we can test — a real pilot in a real village

Pilot: Connect 10 households on a single street to one borehole via a 100m HDPE pipe network. Run for 4 weeks. Measure reliability, willingness to pay, and supplier commitment.

Week 1 — **Partner & Register**

Identify borehole owner partner. Knock on 10 doors, explain AquaLink, collect verbal or written sign-up agreements. Collect first month's subscription upfront.

Weeks 1–2 — **Install the Network**

Lay 20mm HDPE pipe from borehole to each home. Install flow meter at borehole outlet. Build 500L gravity-fed buffer tank. Conduct full pressure test.

Weeks 2–4 — **Go Live & Monitor**

Open household taps. Supplier monitors levels on dashboard. Admin tracks purchases. Flow meter auto-records litres. Supplier payment calculated weekly.

Week 4 — **Evaluate & Decide**

Visit each household: Was water reliable? Is R250 affordable? Will you continue? Review all data. Present findings. Decide on street-by-street expansion.

VISION & IMPACT

What AquaLink means for South Africa's villages

"To provide every rural household in South Africa with a home tap and safe, reliable water — not tomorrow, but starting with one pipe, one street, one village at a time."

Dignity for the Elderly

No more elderly grandparents walking kilometres to carry water home. A tap at their door changes everything.

Safety for Children

Children no longer exposed to unsafe river water or long collection walks. More time for school, more safety at home.

Income for Suppliers

Borehole owners earn a regular, tracked income — formalising an existing but disorganised part of the village economy.

Scalable Across SA

Muraleni is one village. The model works anywhere. Every village with a borehole is a potential AquaLink node.

Data-Driven Management

For the first time, village water usage is tracked, analysed, and optimised — creating a foundation for formal infrastructure.

Community Ownership

AquaLink is built by people from the community, for the community — ensuring it serves real needs, not assumptions.
